

SMobile Security Shield Enterprise Edition

Enterprise Edition Client

- **Antivirus:** Scans and removes mobile Spyware, Trojans, Viruses and Worms via Real-Time scanning, scheduled scans and automated antivirus signature updates
- **Firewall:** Protects all device interfaces, including 3G, Wi-Fi, Bluetooth
- **Anti-Spam:** Stops unwanted voice and text communications
- **Remote Lock , Wipe and Backup:** Send commands to lock devices and backup and delete data from lost or stolen devices
- **Remote GPS Locate:** Pinpoint the exact location of lost or stolen devices or employees and display the location in an online map
- **Application Revocation:** Identify and remove unwanted applications from devices
- **Enterprise Controls:** Gain insight into the mobile activities performed on device by reviewing the contents of SMS/MMS messages, e-mail, voice call logs, contact lists, etc.
- **Supports All Smartphone Devices:** Including BlackBerry, Windows Mobile, Symbian and Android (Select applications available for iPhone)

Studies have found that 63% of workers carry two or more mobile devices daily. This growth in both mobile and remote service usage has created an "IT crisis for many companies as they struggle to adapt their technology and support infrastructures to meet a new set of demands."

"With more employees using more devices and applications, there's an increased complexity in support demands," he said. "Without a proactive strategy, workers are in essence defining the policy of what devices and applications can be used and assuming they'll be supported."

-Chris Kenton, SVP at BPM Forum

SMobile Security Shield Enterprise Edition is the most comprehensive mobile security suite available today to address the full range of threats to mobile devices including:

- Malware/Viruses/Spam
- Lost and Stolen Devices
- Direct Attack
- Mobility-related Misconduct

Built on top of our industry-leading mobile virus detection engine, Security Shield Enterprise Edition utilizes a robust and powerful set of capabilities designed and optimized for mobile devices. All key features of the on-device Security Shield client are controlled from the web-based management console. In addition, the enterprise customer is provided with comprehensive reporting and alerts via the fully integrated reporting system, allowing true and full insight into all device activity across the enterprise.

Enterprise Edition Management Console

- Centralized Administration:**
 Configure, Control and Report on all security activities and policies from a single interface
- Easy Deployment:**
 The web-based SMOBILE management console can be hosted by SMOBILE for seamless deployment, or hosted on the customer premise. The console is also available as an appliance
- Detailed Reporting:**
 Real-time reporting provides administrators with usable data to determine the current security state of mobile devices, including virus outbreaks
- Control Over Mobile Devices:**
 IT Administrators can easily implement firewall rules, set frequency of antivirus updates and scans and issue commands to update or locate a device.

With many employees downloading and installing their own software onto mobile devices, having control over these applications presents a growing challenge to the enterprise. Many third party applications such as Instant Messaging, VOIP, and P2P file sharing can introduce new security threats, and expose the company network to illicit, inappropriate, or illegal content. SMOBILE Security Shield Enterprise Edition with Application Revocation enables an enterprise to control the applications allowed to run on their employee's mobile device.

By nature, mobile devices are particularly susceptible to becoming lost or stolen. The SMOBILE Enterprise Console enables administrators to easily issue lock, unlock, wipe, locate and backup commands to ensure that sensitive data is removed from devices, while still ensuring it is available to the user when a new device is provided. The GPS locate command is able to map the exact location of the device, thus making devices recoverable and lessening the need and inconvenience of unnecessarily wiping all temporarily misplaced devices.

Supported Operating Systems:

- BlackBerry
- Windows Mobile
- Symbian
- Android
- iPhone (Select Features)
